

ABSTRACT OF THE DISCLOSURE

A coupler enables a paintball hopper to be easily connected to and disconnected from a paintball marker. A part of the coupler is connected to the paintball marker while another part is connected to the paintball hopper. The coupler has a locked and an unlocked position. In the unlocked position, the portion of the coupler connected to the paintball hopper is easily removed from or inserted into the coupler. In the locked position, the paintball hopper is held immobile and capable of being used in a competitive environment. The coupler provides fixed positions while locked and uses techniques to keep the hopper immobile when locked to the paintball marker.
